

Some security issues in wireless computer networks, application of building security solutions using Radius Server authentication method.

Nguyen Khac Thinh

Abstract: In the current digital era, wireless computer networks have become an important part of information technology infrastructure. This topic focuses on analyzing and proposing security measures for wireless network systems, specifically deploying the Radius Server authentication solution to enhance security. The main objective of the research is to build an effective automatic authentication and access control system. Through a combination of theoretical research and experimentation, the topic aims to contribute new security solutions for wireless networks, meeting the increasing demands for information safety in the digital technology environment.
