

Build a program to manage and backup contacts and messages on Android.

Nguyen Van Long

Abstract: In practice today, managing personal information such as contacts and messages on Android mobile devices is becoming increasingly important. This project aims to build an effective management system for backing up and restoring this critical data on the Android platform. Through theoretical research on data protection, combined with the implementation of a practical application, the project will provide a robust personal information security solution. The expected outcome is to create a system that can be widely used by organizations and individuals, contributing to the protection of user information security.
