

Research on building an application system for document storage integrated with a document management system for operational administration.

Le Dang Hien

Abstract: This topic is proposed to address the issue of inefficient management and storage of official documents in state agencies. The objective of the research is to build an integrated application system between document storage and the operational document management system, aiming to improve the quality and flexibility of the work processing workflow. The approach includes both theoretical research and experimentation to deploy the application. The expected result is a system that effectively supports document management in agencies, thereby enhancing productivity and reducing labor costs.
