

Building a website for the tutoring center "The Future"

Kim Tat Thang

Abstract: In the context of increasingly fierce competition among educational centers, this project aims to design and deploy a professional website for the tutoring center 'The Future', providing an effective online learning solution. Through theoretical research on web development combined with experimentation, the project will analyze the needs of students, teachers, and parents to build a user-friendly interface and a flexible content management system. The deployment of this website not only helps 'The Future' enhance marketing effectiveness and information management but also contributes to improving the quality of online teaching services, thereby bringing benefits to both the provider and customers.
