

Building a nursery environment management program

Mai Văn Hiện

Abstract: This topic focuses on building a nursery environment assurance management system to address quality management and efficiency issues in the cultivation process. Through theoretical research combined with experimentation, the system will support the optimization of plant care processes, thereby enhancing the productivity and quality of the final product. The objective of the topic is to develop a diverse technical solution that meets practical needs, while also providing indicators for evaluating environmental management effectiveness. The implementation of the system is expected to bring many benefits to the agricultural industry by improving nursery quality and minimizing waste.

Keywords: Nursery management, environmental assurance, management system, agricultural techniques, process optimization
