

Build a sales management program using C# language

Vuong Quoc Dang

Abstract: This topic aims to build an efficient sales management system by applying the C# programming language. The current context requires businesses to have automated sales management tools to optimize sales processes and enhance productivity. The topic applies theoretical research on C# combined with practical implementation to build a comprehensive sales management system, from the user interface to functions such as order management, inventory management, and revenue reporting. The expected result provides a useful application solution for small and medium-sized enterprises in improving business performance.

Keywords: Sales management, C#, enterprise management system, user interface, revenue report
