

Research on Google's web-based programming interface, applied to building a schedule management system using the Google Calendar API.

Do Thi Sen

Abstract: This topic focuses on researching and implementing a schedule management system based on the Google Calendar API. The context of the topic arises from the necessity of effective time management tools in current practice. The goal is to build a web application with an easy-to-use programming interface, allowing users to create, manage, and share personal and group schedules. The research method combines theory with experimentation, including technical analysis of the Google Calendar API, user interface design, and web application deployment. The topic is expected to provide a convenient solution for time management and increase work productivity.

Keywords: Google Calendar API, schedule management, web system
