

Building an English teaching program for children on mobile devices

Vu Thi Hang

Abstract: In the context of education increasingly developing towards digital trends, this topic aims to address the lack of suitable teaching methods for children by building an English teaching program on mobile devices. The objective of the research is to create a highly interactive online education system that meets the autonomous learning needs of young children. The method combines theory and experimentation to develop teaching content appropriate for modern digital skills. This topic promises to make an important contribution to improving educational effectiveness through flexible learning formats, promoting wider access to foreign language courses.
