Building the accounting subsystem for production cost aggregation and product cost calculation at DIESEL Song Cong Company.

Nguyen Thi Nhu Quynh

Abstract: This topic aims to research and develop a technical solution for managing production costs and calculating product costs at DIESEL Sông Công company. The practical context shows the necessity to improve the existing accounting process, ensuring accuracy and efficiency in the cost allocation process. The objective of the topic is to develop an automated cost management system to enhance productivity and optimize corporate profits. The research methodology includes synthesizing theoretical knowledge, analyzing practical situations at the company, and designing the system according to specific requirements. The expected result is to provide a useful solution to improve the company's financial management, while contributing to the field of production accounting in general.
