

Building an ATM card transaction management information system at AGRIBANK branch in Nho Quan district, Ninh Binh province.

Le Thi Hang

Abstract: This topic focuses on building and deploying an efficient ATM card transaction management information system at AGRIBANK Bank, Nho Quan district branch, aiming to address issues such as enhancing security, improving transaction processing speed, and optimizing customer service processes. The research method combines analyzing real-world requirements, designing and implementing the system through data modeling and programming. The objective of the topic is to build a robust automation system that provides reliable support for banking operations and improves service quality. The expected results of the topic not only demonstrate direct applicability in ATM card transaction management but also contribute to the development of information technology in the banking industry.

Keywords: Information system, ATM card, AGRIBANK, Transaction management
