

Building an application for the cash-accounting subsystem at Hoang Trieu steel trading enterprise.

Nguyen Thi Duyen

Abstract: This topic focuses on building an application system to support cash and deposit management for Hoang Trieu steel trading enterprise. The topic selection is based on the fact that the current system is facing many difficulties in cash flow management, thereby causing financial risks and reducing operational efficiency. The objective of the research is to build an automation solution to enhance financial management efficiency. The research method combines accounting theory with practical application deployment to ensure the feasibility of the project. The expected results from this research will bring significant improvements in cash control and usage, while contributing to strengthening financial governance for the enterprise.

Keywords: cash accounting, mobile application, financial management
