

Research on Advanced Broadband Integrated Services Digital Network (B-ISDN Advanced)

Phạm Thị Hồng Nhung

Abstract: This topic aims to research and develop advanced broadband integrated services digital network (B-ISDN) technical processes, meeting high quality of service requirements in practice. Through this, we will combine theoretical research methods with experimentation to build an efficient B-ISDN network system. The project is expected to make important contributions to the field of information and communication technology, enhancing flexibility and the capacity to handle diverse services on the network.

Keywords: B-ISDN, broadband integrated services digital network, research and development, network system
